                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel method for identifying a subject at risk of breast cancer which comprises detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a risk of breast cancer, as well as therapeutic and prophylactic treatments that specifically target breast cancer, such as gene therapy. The current sequence is that of an Extend primer of the invention which was used to genotype single nucleotide polymorphisms within human chromograpin B (CHGB; secretogranin property in the contraction of the contraction which was used to genotype single nucleotide polymorphisms within human chromograpin B (CHGB; secretogranin contraction).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying a subject at risk of breast cancer by detecting the presence or absence of one or more nucleotide polymorphic variations, useful for diagnosing, preventing and/or treating breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          breast cancer; cytostatic; gene therapy; human; chromogranin B; CHC secretogranin 1; SCG1; chromosome 20pter-p12; ss; PCR; primer; SNP; single nucleotide polymorphism.

The oligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group or individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. agammaglobulinaemia, diabetes inspindus, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease, osteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune diseases, including, rheumatoid arthritis, multiple selerosis, includes the content of the content 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            primer extension (SNPE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a nucleic acid sample by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Single nucleotide polymorphism; SNP; single nucleotide primer extension; SNPE; genotyping; agammaglobulinaemia, diabettes insipidus; cancer; Lesch-Nyhan syndrome; muscular dystrophy; familial hypercholesterolaemia; polycystic kidney disease; osteogenesis imperfecta; autoimmune disease; acute intermittent porphyria; rheumatoid arthritis; multiple sclerosis; inflammation; forensic investigation; paternity analysis; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel antisense compound (I) 8-30 nucleobases in length targeted to a polynucleotide encoding human telomeric repeat binding factor 2 (II) which specifically hybridizes with, and inhibits the expression of (II). (I) is useful for treating a human having a disease or condition associated with (II) such as premature aging or a hyperproliferative disorder especially cancer, by inhibiting the expression of (II) in human cells or tissues. (I) is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. The products of the invention have cytostatic activity. This sequence represents an antisense oligonucleotide used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Homo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antisense; phosphorothioate; human; telomeric repeat binding factor 2; inhibitor; premature aging; hyperproliferative disorder; cancer;

for in vitro detection of homozygous deletion a hepatocellular carcinoma cell line.
                                                                                                                                                                                                                                                                                                                                                                                                                     (HCC) homozygous deletion PCR
                                                                                                                                      MEDICALE
                                                                                                                                                                                                                                                                                                                                                                                  8p23; ss; primer; PCR
                                                                                                                                                                                                                                                                                                                                                                                                                       primer #28
```

The invention relates to an isolated nucleic acid used for detection of human hepatocellular carcinoma (HCC), through homozygous deletion in human chromosome 8p23. The deletion within the 345 kilobase region flanked by the 370L3SP6 and loci markers. Sequences ABK70649-ABK70700 represent PCR pri Disclosure; Page 14; 32pp; English. loci markers. Sequen detect the deletion chromosome 8p23 of indicative of HCC primers used to is located 315117fg8D in vitro detection

A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, inmunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing benefit to adenosine, receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition where the second of the composition of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; antisense; lung dysfunction; nasal airway dysfunction; antiinflammatory steroid; ubiquinone; antiinflammatory; antiallergic; antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel pharmaceutical composition, which has first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions initiation codon,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nyce JW, Li Y, Miller S, Tang

initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or in a subject of the region of the prophylactic or the respiratory bronchodilation, increasing levels of ubiquinone or in a subject of the region of the prophylactic or the region 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nyce JW,
Miller S,
                                                                                                       lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

Composition or cancer and can be anti-sense to the corresponding mRNA.

Composition or cancer and can be anti-sense to the corresponding mRNA.

Composition of the invention has antiallergic, antiinflammatory, antiasthmatic, composition has antiallergic, antiinflammatory, antiasthmatic, composition comprises oligo and is administered to reduce the production of treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The composition, allergies and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, composition rejection, pulmonary infections, bronchotics, pulmonary disease, pulmonary hypoproduction are associated composition rejection, pulmonary infections, bronchitis or cancer.

Composition rejection, pulmonary infections, bronchitis or cancer.

Composition rejection, pulmonary disease, pulmonary pain, cystic fibrosis, allergic rhinitis, pulmonary hypoproduction are pulmonary disease, pulmonary hypoproduction and the readuced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the system and the readuced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the system and the readuced adenosine to the store triangle environment and thereby.                                                                                                                                                                                                                                   cc analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or cc treating a respiratory, lung or malignant disease. The administered cc composition comprises oligo and is administered to reduce the production cc or availability, or to increase the degradation of the target mRNA or to creduce the amount of target polypeptide present in the lungs. The cc pulmonary obstruction, and/or bronchoconstriction and/or lung cc inflammation, allergies and/or surfactant hypoproduction are associated composition, allergies, asthma, impeded respiration, respiratory cc inflammation, allergies, asthma, impeded respiration, respiratory cc typertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. Cc thymidines present in the target RNA serves to prevent the breakdown of the oligonuclectides into product that free adenosine into the system content of the anti-sense oligos corresponding to the oligonuclectides into product that free adenosine into the system content of the anti-sense oligos corresponding to the oligonuclectides into product that free adenosine into the system contents the system contents the system contents the system contents the system conte

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nyce JW,

                                                                                                                                                                                                                      The invention describes a compound 8-80 nucleobases in length targeted to, and which specifically hybridizes with a nucleic acid molecule encoding PTPN12 (protein tyrosine phosphatase, non-receptor type 12), and inhibits the expression of PTPN12. The compound, composition and methods are useful for treating a disease or condition associated with PTPN12, such as a hyperproliferative disorder, e.g. colon cancer, or a metabolic disorder. They are also useful in research and disagnostics for modulating the expression of PTPN12. This sequence represents a human protein tyrosine phosphatase, non-receptor type 12 (PTPN12) antisense
                                                                                                                                                                                                                                                                                                                                                                              New antisense oligonucleotides targeted to a núcleic acid encoding protein tyrosine phosphatase, non-receptor type 12 (PTPN12) useful treating a disease associated with PTPN12, e.g. colon cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human PTPN12
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         22-APR-2004

The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy(les), asthma, impeded respiration, cystic fibrosis (CR), chronic obstructive pulmonary diseases (CDPD), allergic rhintis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway the present and oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codons and introns of respiratory disease-relevant genes e.g., CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory

Human mPGES-1 chimeric antisense oligonucleotide SEQ ID NO:1573

0

```
The present sequence represents a chimeric antisense oligonucleotide crargeted to human microsomal prostaglandin E2 synthase (mPGES-1). The CC human mPGES-1 gene is located on chromosome 9, more specifically to CC 934.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding CC mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and CC mPGES-1; by the syression; (2) a method of inhibiting the expression of CC mPGES-1 in cells or tissues; and (3) a method of treating an animal CC having a disease or condition associated with mPGES-1. MPGES-1 chimeric CC antisense or condition associated with mPGES-1. MPGES-1 chimeric CC antisinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological, immunomodulator, cardiant, neuroprotective, contininflammatory, neuroprotective, nootropic, antisense compound CC can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's CC condition associated with mPGES-1 e.g., inflammation, Alzheimer's condition associated with mPGES-1 e.g., inflammation, Alzheimer's condition of the condition injury, or condition of the condition injury, or condition associated with mPGES-1 e.g., inflammation, Alzheimer's condition injury, or condition of the condition injury, or condition conditions are composition injury, or conditions are conditions and can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's conditions are conditions of the condition injury, or conditions are conditions of the condition injury, or conditions are conditions of the conditions of the conditions of the condition injury, or conditions are conditions of the condition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mpCES-1; mpGES-1 inhibitor; microsomal prostaglandin E2 synthase; mpCES-1; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; nootropic; antiarthritic; vasotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁
chosen from a gene encoding interleukin (II)-4 receptor, interleukin (II)-5 receptor, CCR1, CCR3, Botaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDB4 A, PDB4 B, PDB4 C or PDB4 D. The invention also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the prevention and/or treatment of a respiratory or lung disease. The oligonucleotides are useful for reducing or inhibiting expression of a gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CCR1, CCR3, Botaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDB4 A, PDB4 B, PDB4 C, or PDB4 D. The oligonucleotides are useful for preventing or treating a respiratory or lung disease. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 respiratory or lung disease is associated with hyper-responsiveness to and/or increased levels of, adenosine and/or levels of adenosine A receptor(s), and/or asthma and/or lung allergies associated with inflammation or an inflammatory disease. The respiratory or lung disease is chosen from airway inflammation, allergy, asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary disease (COPD), allergic rhinitis, acute respiratory distress syndrome, pulmonary hypertension, lung inflammation, bronchitis, airway obstruction or bronchoconstriction. This sequence represents an oligonucleotide of the
                                        The invention identifies a genetic locus ASTH1, associated with asthma, mapped to human chromosome 11p. ASTH11 and ASTH11 are genes present within the locus, located close to each other on human chromosome 11p, and have similar patterns of expression, and common sequence motifs. The ASTH1 genes and fragments, encoded protein, genomic regulatory regions and anti-ASTH1 antibodies are useful in the identification of individuals predisposed to development of asthma, and for the modulation of gene activity in vivo for prophylactic and therapeutic purposes. The ASTH1 protein is useful as an immunogen to raise specific antibodies, in drug screening for compositions that mimic or modulate ASTH1 activity or expression, including altered forms of ASTH1 protein, and as a therapeutic. Sequences AAZ18366-Z18509 represent polymorphisms in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAZ18411 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 20
                                                                                                                                                                                                                                                                                       Mammalian asthma related genes, useful for diagnosis of a predisposition to development of asthma.
                                                                                                                                                                                                                                                                                                                                       WPI; 1999-479058/40

                                                                                     family of transcription factors, which have been implicated in the activation of a variety of genes including the TCRa gene and cytokine genes known to be important in the actiology of asthma. Both ASTHII and ASTHII mRNAs are alternatively spliced. Alternative splicing of transcripts has no effect on the open reading frame of ASTHIU, as the exons involved are all 5' to the start codon in exon b. In contrast, alternative splicing of ASTHII transcripts results in 3 different ASTHII isoforms. The invention also encompasses mouse asthlj protein. The ASTHI nucleic acids are useful as diagnostics to identify a hereditary predisposition to asthma, as probes for identifying ASTHI related genes, for identifying expression of the gene in a biological specimen, and for generating genetically modified non-human animals or site specific gene modifications in cell lines. The encoded ASTHI proteins are useful as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to the ASTH1 locus on the short arm of human chromosome (1D). This locus comprises the ASTH1I and ASTH1J genes, which are associated with a genetic predisposition to asthma and bronchial hyperreactivity. The ASTH1I and ASTH1J genes are oriented in opposite directions with the ASTH1 locus, and have similar patterns of expression and common sequence motifs. They are both expressed in trachea, lung and several other tissues. ASTH1I and ASTH1J are novel members of the ets
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  bronchial hyperreactivity; ets family; transcription factor; splice variant; genetic predisposition; polymorphism; antibody; drug screening; prophylaxis; therapy; diagnosis;

therapeutic. The ASTH1 genes or fragments thereof, encoded proteins, ASTH1 genomic regulatory regions, and anti-ASTH1 and anti-ASTH11 and anti-ASTH11 and inti-ASTH11 and inti-ASTH11 and inti-ASTH11 and inti-ASTH11 and intibodies are useful in the identification of individuals predisposed to development of asthma, and for modulation of gene activity in vivo for prophylactic and therapeutic purposes. The intact ASTH11 or ASTH11 proteins or active fragments thereof may be used to modulate or reduce bronchial hyperreactivity. Sequences AAA80260-A80261 and AAA80264-A80416 represent polymorphic sites within the ASTH11 or ASTH11 genes

                           primer extension (SNPE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Single nucleotide polymorphism; SNP; single nucleotide primer extension; SNPE; genotyping; agammaglobulinaemia; diabetes insipidus; cancer; Lesch-Nyhan syndrome; muscular dystrophy; familial hypercholesterolaemia; polycystic kidney disease; osteogenesis imperfecta; autoimmune disease; acute intermittent porphyria; rheumatoid arthritis; multiple sclerosis; inflammation; forensic investigation; paternity analysis; PCR primer; 88.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0
```

The present sequence is that of single nucleotide polymorphism (SNP) probe MPO/A. The probe has the rhodamine dye dR6G at its 5' end and nitrothiazole blue (NTB) at its 3' end. It was used in a multiplex endpoint SNP analysis that demonstrated the use of novel non-fluorescent asymmetric cyanide dye compounds of the invention (NTB in the present case) as quenching reporter dyes. A 7-colour homogeneous detection of

Example 4; Col 66; 62pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PCR 5'-nuclease, or Tagman, assay. The test system was a set of 3 SNPs, CC denoted MPO, BAK and LIG. Each SNP system consisted of 2 primers (see ABA91969-74) and 2 sequence-specific probes (see ABA91975-80), each ABA91969-74) and 2 sequence-specific probes (see ABA91975-80), each CC dag, dTMR, DROX and JAZ) at the 5' end. The 7th colour was from CC aluminium phthalocyanine tetrasulfonate, used as a passive reference. CC following PCR, the reactions were measured on a luminescence spectrometer CC in synchronous scanning mode. The spectral overlap in the set was CC evaluated by calculation of the conditioning number of the 7x7 matrix (dye fluorescence versus wavelength). The small value of the condition CC number (1.5) proved that crosstalk between the dyes was minimal. SNP CC analyses of known, synthetic target DNA sequences (see ABA91981-90) and CC genomic DNA (from human blood samples and Raji (ATCC CCL-86) cells) were CC plotted as normalised, subtracted spectra and as data points in dot plotted as malitablex PCR system provides increased sample throughput and CC potential cost sevince.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

The invention provides nucleic acid markers of prostate, breast and bladder cancer. The markers are indicators of malignant transformation of prostate, breast and bladder tissues and are diagnostic of the potential for metastatic spread of malignant prostate tumours. The nucleic acid can also be used as targets for therapeutic intervention in prostate cancer, benign prostatic hyperplasia (BPH), bladder cancer or breast cancer. The markers may be used to design specific probes and primers, for the rapid analysis of prostate, bladder or breast biopsy samples. The probes and primers may also be used for in situ hybridization or in situ PCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acid marker; biomarker; tumour; benign prostatic hyperplasia; BPH; breas diagnosis; PCR primer; ss.

They may also be used to identify and isolate full length gene sequences form various DNA libraries. Antibodies against the polypeptide products of the markers can be used to treat prostate cancer, bladder cancer or breast cancer. The encoded proteins may be used to detect antibodies. The proteins and antibodies can be used in immunodetection methods for detecting or quantifying the cancers, and for clinical diagnosis of these cancers. The antibodies may also be used for
                                                                                                                                                             that specifically hybridise to prostate cancer, benign prostatic hyperplasia (BPH), bladder cancer or breast cancer markers. Proteins hyperplasia (the mucleic acid markers can be used to produce antibodies ferenceded by the mucleic acid markers can be used to produce antibodies for the detection of prostate, breast or bladder cancer. The nucleic acids can be used as targets for therapeutic intervention in these diseases, the identification and isolation of full-length gene sequences, including the identification and isolation of full-length gene sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          diagnosing, prognosing, and bladder cancer.

                                                                                                                                                                                                                                                                           The present invention relates to methods for distinguishing between individuals homozygous for and therefore afflicted with Van Buchem's disease, individuals heterozygous for and therefore carriers of Van Buchem's disease and individuals who are not afflicted with Van Buchem's disease comprise identifying a large genomic deletion in chromosome 17 at 17q21. The method is useful for identifying individuals who are afflicted with or carriers of diseases associated with one or more genomic deletion, particularly Van Buchem's disease, which is a rare autosomal recessive disorder that results in a bone dysplasia referred to a craniotubular hypertosis. The present sequence is a PCR primer used to amplify 92Kb gene fragment in human chromosome 17 at 17q21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; Van Buchem's disease; genomic deletion; craniotubular hypertosis; autosomal recessive disorder; chromosome 17; chromosome 17q21; bone dysplasia; 92Kb gene fragment; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Methods for identifying subjects who are afflicted with or carriers of diseases associated with genomic deletion(s), e.g. Van Buchem's disease, by determining the presence of a deletion in the 92 kb region of human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Homo sapiens.

                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method of amplification by polymerase chain Cr reaction (PCR) is by using an artificial chromosome or a large DNA Cr fragment of 50-5000 base pairs in length as template and an Alu-specific primer. Also included is a method for preparing a fluorescence-labelling probe comprising obtaining a polymucleotide product by performing the PCR amplification and fluorescence-labelling the polymucleotide product to give the probe. The method is useful for eliminating a repeat sequence in a genome, which is applicable in preparing genome chips from artificial chromosome for use in diagnosis of genetic diseases, pre-labour diagnosis by screening genetic diseases in pregnant women, tumour typing, diagnosis and prognosis tests and studying damages of radioactive rays and other environmental factors on humans. With this method, FISH (fluorescence inste hybridisation) probes can be produced with elimination of the Alu repeat sequence and enhanced accuracy by effectively reducing non-compared the human Alu specific PCR primer Alu-N2
                                                                                                                                                                                                                                                                                                                                           Query Match

A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of abelled reverse transcription primers (GENESEQ files AAO75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 21 BP; 2 A; 0 C; 0 G; 19 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                   A set of primers (Q97448-Q97455) was designed to enable the PCR amplification of the human beta-globin gene cluster. A fixed downstream primer was paired with a series of upstream primers that amplify a region extending upstream across the delta-globin gene and into the second intron of the A-gamma globulin gene. Targets of 13.5, 17.7, 19.6 and 22 kb were amplified from total human genomic DNA. A new method was used to amplify the large genomic sequences in which Thermus thermophilus DNA polymerase was used in combination with a second DNA polymerase from Thermococcus litoralis, Pyrococcus sp. or Thermatoga maritima. The present sequence (primer RHJ020) is an upstream primer corresp. to nucleotides 52152-52172 of the human beta-globin gene cluster (Genbank Acc.No. J00179) and has a Tm of 63 deg.C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    EP669401-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PCR amplification; thermostable DNA polymerase; combination; large fragment; genomic mapping; sequence analysis; beta-globin;

                                                                                                                                                                                                                                                                                                                                                                    ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC determining the alleles present in short tandem repeat loci from one or CC determining the alleles present in short tandem repeat loci from one or CC more DNA samples. The DNA samples to be analysed has a set of at least CC consisting of D301539, D482368, D58818, D78820, D98930, D1081239, CC CONSISTING OF D301539, D482368, D58818, D78820, D98930, D1081239, CC D138317, D148518, D148548, D148563, HUMCSF1DD, HUMTPOX, HUMTHO1, CC HUMFESFPS, HUMF13A01, HUMBFXIII, HUMLIPOL and HUWWFPA31. Alternatively, CC the DNA sample to be analysed has a set of three short tandem repeat loci which can be amplified together, where the set of loci is selected from CC which can be amplified together, where the set of loci is selected from CC the DNA sample to be sets: (1) D38139, D198253, D13817; (2) D1081239, CC D98930, D269481; (3) D1081239, D482368, D208481; (3) D1081239, D482368, D208481; (3) D1081239, D482368, D208481; D1081239, D78230, D138317; The CC loci are co-amplified in a multiplex amplification reaction (MAR), where the product of the reaction is a mixture of amplified alleles from each cof the co-amplified loci in the set. The amplified alleles in the mixture can analysed in the set within the DNA sample. The methods are used for the CC are evaluated to determine the alleles present at each of the loci can be set within the DNA sample. The methods are used for the CC detection of short tandem repeats as genetic markers for the development cof linkage maps, the identification and characterisation of disease cC genes, and the simplification and precision of DNA typing
                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

A fragment of 167 bp is produced. The primers are used in a method for identifying mutations in the BRCA1 gene using a multiplex amplification process. Mutations in BRCA1 are associated with ovarian and breast cancer. A sample is tested for mutations in the BRCA1 gene by amplifying at least one (partial) exon of the gene, and comparing the sizes and amounts of amplification products with corresponding products of the wild-type gene. Amy differences indicate a mutation. If no mutations are detected, the sequence of at least one exon may be determined. This method is inexpensive enough to be used for large scale
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detecting mutation(s) in the BRCA1 gene by exon amplification comparing amplification products with those from wild type ger optionally followed by sequencing.

Both primers are located within introns of hTSC. 27 Sets of specific primers (see AAV40565-V40618) were used for SSCP analysis of hTSC. Amplified products were analysed for molecular variants by electrophoresis, and identified variants were sequenced. Complete linkage of Gitelman's syndrome with TSC was demonstrated. Identification of the molecular basis of Gitelman's syndrome allows for the genetic diagnosis of this disorder. The invention provides products and methods useful for diagnosis and treatment of Gitelman's syndrome and other ion transport

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC on a gene vital for treatment of cancer, where the inhibitor is active CC on a gene vital for cell growth or viability, and where the gene is gubject to loss of heterozygosity (LOH) in a cancer. The inhibitor is CC used for preventing the development of cancer in a patient having a CC precancerous condition, by administering to the patient a first allele CC precancerous condition, by administering to the patient a first allele creater in cells of the precancerous condition, where the normal somatic CC cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene CC present in a population and targets only one allelic forms of the gene CC used in the diagnosis, prevention and treatment of LOH disorders, e.g. CC cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic CC lesions, benign tumours, endometriosis, polycystic kidney disease, and CC graft versus host disease. The method can also be used to remove compared to the man polymorphic sites described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 21 BP; 4 A; 6 C; 7 G; 4 T; 0 U; 0 Other;
                                                                                     region in a genetic locus using bracketing locus compatible or specificalibrating markers. The method can be used to determine DNA fragment lengths of a polymorphic region (PR) of a genetic locus, especially containing short tandem repeats. AAX30221 to AAX30248 represent PCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Synthetic.

AAA47201-307 are oligonucleotide primers used to amplify human genomic CC DNA short tandem repeat (STR) loci. The claimed method comprises CC simultaneous determination of the alleles present in a set of loci from cone or more DNA samples. In particular, at least thirteen loci of genomic CC DNA are amplified in a single multiplex reaction. At least one of the CC loci is preferably a STR locus with a repeat unit of five to seven bases CC or base pairs in length. Preferred loci are thirteen human STR loci CC chosen by the United States Federal Bureau of Investigation as core loci for use in the Combined DNA Index System (CODIS) database. These loci are D3S1538, HUWTHO1, D2IS11, D18S51, HUWWRA31, D8S1179, HUWTPOX, HUWFIBRA, CC amplified include pentanucleotide STR loci G475, C221 and S159 (see CC AAA47308-10). Loci with intermediate length repeats can be amplified with intermediate length repeats can be amplified with CC comprises; (a) obtaining at least one DNA sample; (b) selecting a set of loci of the DNA sample comprising at least 13 short tandem repeats loci complified amplified alleles from each of the co-amplified loci in the set in a multiplex amplified alleles from each of the co-amplified loci in the set in a continue the action reaction, the product of the reaction comprising a present at each loci. The method can be used to determine the alleles of contildren, confirm the lineage of animals and agricultural crops. It is samples found at a crime scene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT 967

                                                                                                                                                                                                                                                  밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ś
                                                                                                                                                                                                                                                                            The invention provides a DNA polymerase composition for the PCR CC amplification of long (over 10 kb) nucleic acid sequences. The amplification of long (over 10 kb) nucleic acid sequences. The CC composition includes the DNA polymerase of Thermus thermophilus and a second, thermostable, DNA polymerase that provides 3'-to-5' exonuclease cC activity. Use of the composition was demonstrated for the amplification regions of the human beta-globin gene cluster, as a model for genomic trargets that are likely to contain repetitive sequences and homologous sites elsewhere in the genome. The second DNA polymerase was provided by Thermotoga maritima. Primers were designed such that a fixed downstream cc primer (see AAI70312-13) could be used with a series of upstream primers (see AAI70306-11), including the present primer, RH1020, which corresponds to nucleotides 52152-52172 of the human beta-globin gene cc cluster. Targets of 7.5-22 kb were amplified. The target region extended CC upstream across the delta-globin gene and into the second intron of the A camma globin gene. Use of primer RH1020, which lies within an Alu repeat cc sequence, resulted in multiple secondary products
                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to DNA for a promoter and an L1 cassette sequence having a core retrotransposon element. The invention is useful for random insertion of a heterologous or homologous DNA sequence into cell genome, and for correction of a genetic defect in the cell into which the insertion is made. Genetic defects which may be corrected includes cystic fibrosis, mutations in the dystrophin gene, genetic defects associated with blood clotting and other genetic defects
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Retrotransposon;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention CC includes kits for determining the presence or absence of a SNP, using the CC oligonucleotides of the invention. The PCR primers are used to amplify a CC SNP flanking sequence, the SNPE primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The CC oligonucleotides are useful for determining the presence, absence or CC identity of a SNP and for genotyping nucleic acid sample by endividuals, having a pathological phenotypic trait suspected of being CC caused by one or more SNPs. Phenotypic traits include diseases e.g. CC agammaglobulinaemia, diabetes insipidus, Lesch-Myhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease, osteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial cdiseases, including, rheumatoid arthritis, multiple sclerosis, include matching, rheumatoid arthritis, multiple sclerosis, and concorganism. The method is also useful in forensic investigations and contermity analysis. The present sequence represents a PCR primer specific for a human SND contration nNA securence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                S

CC She oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The coligonucleotides are useful for genotyping a nucleic acid sample by coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides are useful for determining the presence, absence or coligonucleotides by association analysis the genotypic trait suspected of being constant of the present suspected of being consistency of the present suspected of being constant of the present suspected of being constant and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial consists and includes symptoms of or susceptibility to multifactorial consists and including, rheumatoid arthritis, multiple sclerosis, pathogenic mitroorganism. The method is also useful in forensic investigations and conformation, cancer, nervous system diseases and infection by pathogenic mitroorganism. The method is also useful in forensic investigations and conformation of the present sequence represents a PCR primer specific for a human SNP containing DNA sequence

The method is useful for identifying individuals who are afflicted with or carriers of diseases associated with one or more genomic deletion, particularly Van Buchem's disease, which is a rare autosomal recessive disorder that results in a bone dysplasia referred to a craniotubular hypertosis. The present sequence is a PCR primer used to amplify 92Kb gene fragment in human chromosome 17 at 17q21

                                                                                                                                           The present invention describes a method for producing homozygous stem CC (HS) cells having a target genotype and/or immunotype from non-fertilised CC post-meiosis I diploid germ cells by mitotically activating the germ CC cells to develop multiple blastocyst-like masses, each of which contains CC an inner cell mass (ICM) that is homozygous for the target genotype CC and/or immunotype. The methods of the present invention are useful for CC the production of HS cells utilised for diagnosis, therapeutic and CC cosmetic transplantation, cell replacement and/or gene therapy, and the CC disease, Parkinson's disease (cystic fibrosis, muscular CC disease, Parkinson's disease and multiple sclerosis), traumatic injuries (post-trauma repair and reconstruction, limb replacement, spinal cord CC injuries and burns), cancer, disorders of the epithelium (Dlindness, CC diseases and anaemia. ABG/74028 to ABG/7415 represent PCR primers and CC sequence specific oligonucleotide (SSO) probes which are used in the CC exemplification of the present invention

The polymorphic sequences contained in CYP4501A1, CYP4501A2, AHR, MDR1 and/or MDR3 may also be used to screen individuals for susceptibility to cancer. Polymorphic sequences in ADRB1 or CHMR2 are used to screen for altered cardiovascular function, in COX2 for altered susceptibility to colorectal tumours, in DBI or CHMR1 for altered central nervous system function, in FLAP and HNMT for altered pulmonary, inmunological or haematological function, in KLK2 for altered serine protease activity in the prostate, in LTF for altered immunological function, in CHMR3, CHMR4 or CHMR5 for altered central and peripheral nervous system function. The present sequence represents a peripheral nervous system function. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ABS98168;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ABS98168 standard; DNA; 21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                 WO200257410-A2

Example 22; 714pp; English

CC Cytochrome P450 (2E1 (CIP45004E1), andremerylo receptor nuclear translocator (CC (ARNT), cathepsin (ALHE), aryl hydrocarbon receptor nuclear translocator (CC (ARNT), cathepsin S (CTSS), cyclooxgenase 2 (COX2), diazepam binding CC inhibitor (DBI), epoxide hydroxylase 2 (EPHX2), 5-lipoxygenase activating CC protein (FLAP), glutathione-5-transferase 12 (CGT12), histamine-N-methyl CC transferase (NNMT), (Rallikrein 2) KLK2, nicotinamide -N-methyl CC transferase (NNMT), NADPH quinone oxidoreductase 2 (MOO2), CC (MCR1), UDP-glucuronosyl transferase 2B4 (UGT2B4), Jactotransferrin (LTF), multidrug resistance associated protein 3 (CC (MDR1), lactotransferrin (LTF), multidrug resistance associated protein 3 (CC (MDR1), lactotransferrin (LTF), multidrug resistance associated protein 3 (CC (MRR3), orphan nuclear receptor (WR12), or acetylcholine muscarinic CC receptor 1, 2, 3, 4, or 5 (CHMR1, CHMR2, CHMR3, CHMR3, CHMR3) sequence. CC (MRR3), orphan nuclear receptor (WR12), or acetylcholine muscarinic CC traits within the genome and eventually CC (MRR3), orphan muclear responsible for a variety of disorder-related CC armityling the genes responsible for a variety of disorder-related CC expression, mutation or underexpression, which may be used in diagnosing CC (ARM), multidrug resistance of their e.g., overexpression, constitutive comprising the contained in CYP4501A1, CYP94501A2, CYP4502E1, CC (MR1), MDR1 and/or MDR3 are useful for screening individuals for altered drug CC (MDR1) and MDR1 and/or MDR3 may also be used to screen individuals for altered drug CC (MDR1) and MDR1 and MDR1 and MDR1 and MDR1 and MDR1 and MDR1 and CHMR2 are cc (MDR1) and MDR2 are destine function, in CHMR3, CHMR4 or CHMR5 for altered central and contained in prous system function. The prostate in the for altered central and contained in activation in the prostate, in LTF for al molecule comprising at least one base variation from that of a known human cytochrome P450 A1 (CYP4501A1), cytochrome P450 A2 (CYP4501A2), cytochrome P450 02E1 (CYP4500E1), adrenergic receptor beta1 (ADBR1), This invention relates to the sequence of an isolated nucleic acid molecule comprising at least one base variation from that of a known control of the comprising at least one base variation from the control of the co polymorphic DNA sequence of the invention

Sequence 21 BP; 4 A; 10 C; 4 G; 3 T; 0 U; 0 Other;

(DNAS-) DNA SCI LAB polymorphism

Isolated nucleic acid molecules having polymorphisms in known human genes e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder-related traits.

22; Page 143; 714pp; English

C expression, mutation or underexpression, which may be used in diagnosing cond/or treating the disorders. The nucleic acid molecules comprising the polymorphic sequences contained in CYP4501A1, CYP94501A2, CYP4502E1, CYP4501A1, CYP94501A2, CYP4501A2, C transferase (HNMT), (kallikrein 2) KLK2, nicotinamide -N-methyl transferase (HNMT), waDPH quinone oxidoreductase 2 (MQO2), sulfotransferase thermolabile (STM), UDP-glucuronosyl transferase 2B4 (UGT2B4), UDP-glucuronosyl transferase 2B7 (UGT2B7), UDP-glucuronosyl transferase 2B7 (UGT2B7), UDP-glucuronosyl transferase 2B7 (UGT2B7), UDP-glucuronosyl transferase 2B7 (UGT2B7), multidrug resistance 1 (MRDR), lactotransferrin (LTF), multidrug resistance associated protein 3 (MRDR), orphan nuclear receptor (NR112), or acetylcholine muscarinic receptor 1, 2, 3, 4, or 5 (CHMR1, CHMR2, CHMR3, CHMR4 or CHMR5) sequence. The polymorphisms in the human genes cited in the invention are useful as genetic linkage markers for locating and characterising the genes that are responsible for specific traits within the genome and eventually identifying the genes responsible for a variety of disorder-related traits as a result of their e.g., overexpression, constitutive aryl hydrocarbon (AHR), aryl hydrocarbon receptor nuclear translocator (ARNT), cathepsin S (CTSS), cyclooxgenase 2 (COX2), diazepam binding inhibitor (DBI), epoxide hydroxylase 2 (EPHX2), 5-lipoxygenase activating protein (FLAP), glutathione-S-transferase 12 (GST12), histamine-N-methyl transferase (HNMT), (kallikrein 2) KLK2, nicotinamide -N-methyl This invention relates to the sequence of an isolated nucleic acid molecule comprising at least one base variation from that of a known human cytochrome P450 A1 (CYP4501A1), cytochrome P450 A2 (CYP4501A2), cytochrome P450 02E1 (CYP45002E1), adrenergic receptor betal (ADBR1) ous system function. sequence of the inve

Guida M,

(DNAS-) DNA SCI LAB INC

Isolated nucleic acid molecules having polymorphisms in known human genes e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for

disorder-related traits.

B345 or its immunogenic fragments, also the DNA that encodes it, are useful for immunotherapy of cancer, particularly carcinoma of lung or colon. Antibodies raised against B345 are useful for treatment and diagnosis of cancers that are associated with B345 expression, including their use for targeted delivery of cytotoxic or radioactive agents. Probes derived from B345 can be used to detect tumour specific mutations in the B345 sequence, and can be used to screen for B345 specific modulators. This sequence represents a PCR primer used in the amplification of the human B345 tumour-associated antigen described
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel tumour-associated antigen, designated B345 which has cytostatic activity. B345 is involved in communication, interaction and/or signal transduction with extracellular components and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WO200204508-A1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New tumor-associated antigen B345, useful for diagnosis and immunotherapy of tumors, also related nucleic acid and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       07-JUL-2000;

                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to novel proteins (I) referred to as NOVX, where X is any number from 1 to 18, and their coding sequences (II). The proteins and their coding sequences are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder such as metabolic disorders, diabetes, obesity, infectious diseases (viral, bacterial, fungal, helminthic, and protozoal), anorexia, cancer, cardiovascular diseases (hypertension, atherosclerosis), neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, epilepsy, immune disorders (osteoarthritis), haematopoletic disorders, inflammatory skin disorders, asthma, and various dyslipidaemias. The present sequence is a probe for a NOVX sequence. This sequence has a TET modification at the 5' end and a TAMRA modification at the 3' end.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Vernet CAM, Li L, Shenoy, Macdougall J, Malyankar U, Tchernev V, Zerhusen BD, Baumgartner J, Herrmann J, Taupier RJ, Gerlach V, Gr
                                                                                                                                                                                                                                                                                                                                                            Sequence 21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             16-JAN-2001;

The invention describes an isolated polypeptide, NOVX, comprising a CC sequence or a mature form of one of 21 51-1543 residue amino acid CC sequences (P1-P21), given in the specification. The NOVX polypeptides, CC polynucleotides and antibodies are useful in the manufacture of a medicament for treating or preventing e.g. adrenoleukodystrophy. CC congenital adrenal hyperplasia, haemophilia, hypercoagulation, autoimmune CC disease, allergies, immunodeficiencies, transplantation, Von Hippel-CC Lindau syndrome, Alzheimer's disease, stroke, tuberous sclerosis, CC hypercalcaemia, Parkinson's disease, Huntington's disease, Cancer, CC fertility, diabetes, adult respiratory distress syndrome, viral, CC bacterial and parasitic infections. The nucleic acid sequences may be used in chromosome mapping, identifying individual from minute biological comples (tissue typing), and in forensic identification of a biological comple. This sequence represents a primer used to isolate DNA encoding a covel human protein (NOV)

                                                                                                                                                                                                                                                                                                                The present invention describes an isolated polynucleotide (PN) comprising: (a) a sequence comprising at least 15 contiquous nucleotides of a sequence comprising variant sequences (A) from Table 4 given in the specification; or (b) a sequence that is complementary to (A). Also described: (1) an array of (PN)s comprising two or more of the isolated (PN)s; (2) detecting a (PN) in an individual; (3) a computer-readable storage medium, where each record has a field identifying a base occupying a (PN) site and a location of the polymorphic site; and (4) a signal carrying data for access by an application program having executed on a data processing system. The (PN) can be used for detecting loci associated with multiple sclerosis. ACF64025 to ACF64424 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; detection; computer-readable storage medium; polymorphic site; signal carrying data; data processing system; multiple sclerosis; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ACF64055 standard; DNA; 21

Also described: (1) an array of (PN) so comprising two or more of the isolated (PN)s; (2) detecting a (PN) in an individual; (3) a computer-readable storage medium, where each record has a field identifying a base occupying a (PN) site and a location of the polymorphic site; and (4) a signal carrying data for access by an application program having executed on a data processing system. The (PN) can be used for detecting loci associated with multiple sclerosis. ACF64025 to ACF64424 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  07-AUG-2001; 2001US-0310741P.

The composition and methods are useful in determining in a subject a risk for having, or presence of, altered bone mineral density, such as osteoporosis, osteopenia, bone dysplasia, bone fracture or other conditions characterized by decreased or increased bone density. These may also be used in identifying agents that may be used for treating the above diseases, disorders or conditions associated with altered BMD. In addition, these may be used for pharmacogenomic purposes, e.g. to stratify patient populations according to suitability of a particular therapeutic agent for use in the population. This sequence corresponds to the reverse primer for the alternative human sclerostin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Determining a risk for or presence of altered bone mineral density (e. osteoporosis) in a subject comprises determining the presence or abserof a sclerostin gene region nucleotide polymorphism in a biological

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method of determining a risk for or presence or faltered bone mineral density (BMD) in a subject by determining the presence or absence of at least one sclerostin gene region nucleotide polymorphism in a biological sample from a subject where the presence of at least one polymorphism at a position that corresponds to a non-coding region of the 130320 by sclerostin gene region (SOST) indicates an increased risk of altered BMD. The composition and methods are useful in determining in a subject a risk for having, or presence of, altered bone mineral density, such as osteoporosis, osteopenia, bone dysplasia, bone confirmed density. These may also be used in identifying agents that may be used for treating the above diseases, disorders or conditions associated with a letered BMD. In addition, these may be used for pharmacogenomic purposes, corresponds to the forward primer for the human sclerostin gene region corresponds to the forward primer for the human sclerostin gene region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

The invention describes a method of creating an insertional mutation in the germ line of an animal by introducing into an animal a nucleic acid molecule comprising a germ line specific promoter. The method is useful for generating a mutation in an offspring of an animal, or for isolating a nucleic acid from a genome of an offspring of an animal. The method may also be used to correct genetic defects in animals, especially humans. The nucleic acid is useful for generating mutations in a cell for assessing the frequency with which selected cells under go insertional mutagenesis for the generation of transgenic animals. This sequence represents an exemplary cleavage site of the endonuclease encoded by human L1 retrotransposon EN domain.
